What is the advantage of dynamic properties in C#? It is possible in C# to declare a property as dynamic in which case the compiler creates a type

initializer for it: `public class MyClass {
public dynamic MyProp { get; set; } }`

Is there any reason to use this type of property? It seems to work just like normal properties. A: There are a number of uses. One of the main is to be able to use object as the type, and

pass it around as if it was a reference type (I know it looks like it is, but I have a GetSubtype method I use in my own classes). Consider this: //The benefit is passing anything around as a reference - that's the power of the keyword. dynamic myObject = new MyClass(); //the type is inferred by the compiler as "MyClass", so... Console.WriteLine(myObject.GetSubtype()); Now...how would you pass it around if you could only use a reference type? //Unclear how useful this is - class MyClass { public MyClass SubType { get; set; } public static MyClass GetSubType(object o) { return (MyClass) o; } } A: There are several

advantages: there is no need to implement a get or set accessor you can use it as if it was a normal property it makes it possible to bind to a dynamic property. For more info see [Dynamic Property in C# \(MSDN\)](#) C# a1d647c40b
