A key macro is a script that you can execute in your macro definition and a runbook when you need to run an Add-on or a process within your folder structure. The key macro is called by the App.Read() or the App.Run() method. KEYMACRO Example If you were using C#, here's an example using Microsoft's KeyMacro using Microsoft.VisualBasic.FileIO; using Microsoft.VisualBasic.Compatibility; Module Name: PSSUtils Constants: You'll often need to use a constant in a key macro, but you'll have to hardcode it like so. Public Const FileLocation As String = "C:\Path\To\Files" Public Const BackupFilePath As String = "C:\Path\To\Backups" Sub Main Dim line As String Dim FileHandle As FileIO.TextReader Dim backupFile As String line = "" fileHandle = FileIO.OpenTextFile(FileLocation, ForReading) Do Until FileHandle.EndOfStream line = line + FileHandle.ReadLine() Loop FileHandle.Close() backupFile = File.IO.Directory.GetFileName(FileLocation) + "-" + Time.Now.ToString("yyyyMMddHHmmss") + ".zip" File.IO.Directory.MoveFile(FileLocation, backupFile) Runbook: Now, you can use the constant in the Runbook (assuming it's placed at the top) Runbook code (assuming you're using C#): const string FileLocation = "C:\Path\To\Files"; const string BackupFilePath = "C:\Path\To\Backups"; C# (I don't have a C# compiler right now, so I just use regular old Notepad++): string line = string.Empty; using (TextReader textReader = File.OpenText(FileLocation)) { do { line += textReader.ReadLine(); } while (textReader.EndOfStream); } C# (This is a bit more code but it's your code, so it's your call): const string FileLocation = "C:\Path\To\Files"; const string Backup 81e310abbf
