View this animated presentation (pdf) "X-Particles for Cinema4D" and learn how the easy-to-use X-Particles technology makes creating amazing digital effects a breeze, no matter which software you are using, like Cinema . You no longer need expensive, out-of-the-way hardware to run all your rendering needs with X-Particles' cloud renderer. Once you have a project ready for rendering, Cloud is all you need. You can even share it with others. Take it from an experienced user: X-Particles is a powerful particle system plugin that lets you create amazing effects in your projects. It also supports a 3D renderer. Cinema 4D X-Particles Review! Learn how X-Particles works. Cinema 4D Tutorial X-Particles in Cinema 4D: A Particle Solution in Cinema 4D by Zach Phinney. See more updates for X-Particles. X-Particles is a professional plugin for Cinema 4D that gives you control over the rendering of real-time, particle-based simulations. What's New in X-Particles. X-Particles is a powerful particle system plugin for Cinema 4D. X-Particles has a lot of features, but we've tried to focus on one: particle simulations. Welcome to Cinema 4D. The invention is used for the manufacture of cast strips of any type, for example steel and/or aluminum strips, by continuous casting in a casting mold, with free solidification of the metal melt, on a casting wheel rotating at the desired casting speed. The invention is used in particular for the manufacture of metal strips having a strip thickness of between 5 and 1500 mm, preferably 5-300 mm, in particular 5-100 mm. The cast strips can be made of any metal, preferably steel and/or aluminum and have a final gauge thickness (0.1%) of between 0.1 and 10, in particular 0.1-3, mm, i.e. a casting thickness of between 0.1 and 6, in particular between 0.1 and 3, mm. 2. Background of the Invention Frequently the use of ferritic steels is desired for the manufacture of ferritic steel strips, for example for applications in automotive engineering. In spite of their high machinability, low thermal conductivity and low cost, ferritic steels are expensive. An important contributory factor to the cost is the manufacturing process, which frequently is also complicated. In particular, high scrap and high rejection rates are encountered. It is therefore attempted to provide a cost-efficient process and an apparatus for the continuous casting of a strip of a ferritic steel with a reduced number of steps, in particular a simplified roller cooling. In this way, the costs of the steel manufacturing can be reduced significantly and the associated financial burden on the industry be decreased, the margins on which manufacturers can work increased and the purchasing power of end customers increased. In particular, it is attempted to provide a process and apparatus that permits a reduction in the casting pressure of the cooling system and/or in the roller diameter and a reduction in the number of rollers in comparison to known processes, in particular with respect to the use of high-pressure water and the suction rollers in the cooling system, which involve high costs. It is also attempted to provide a process and apparatus of which the casting wheel or casting mold is longer than the previous apparatus, as a result of which the strip is more solid and the
